Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               963
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            220
                                                                                               The invention relates to a grass plant, which has been genetically modified to substantially inhibit generative propagation and carry herbicide resistance. The grass is useful for growth and/or propagation of grasses. The grass is used to play at least one sport (e.g. baseball, cricket, football, golf, rugby, soccer or tennis), or used at least in portion of an athletic field, lawn or park. The grass is fed to animal (e.g. cattle, goat, horse or sheep) or used as an animal feedstuff. The present sequence represents the amino acid sequence of Arabidopsis Athl protein, which was used to inhibit flowering in grasses
                                                                                                                                                                                                                                                                                                                                                                                                                                                      20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  80
New genetically modified grasses that express inhibited generative propagation, or herbicide resistance, useful for forage (e.g. cattle feedstuff) or amenity purposes (e.g. for use in an athletic field, lawn

modified to substantially inhibit generative propagation. The genetically modified to substantially inhibit generative propagation. The genetic modification may result in a heritable change in one or more plant characteristics such as inhibition of flowering (or substantial delay trat amounts to inhibition), absence of inflorescence, increased correct that amounts to inhibition), absence of inflorescence, increased correction of tillers, delayed heading and inhibition of the developmental switch from vegetative to generative growth. A method of making a grass involves transforming the grass with a nucleic acid which applying a phytohormone to at least partially relieve or reverse a change in plant characteristic resulting from genetic modification. The correction genetically modified grass is useful for growing and/or propagating grass in athletic fields (for sports such as baseball cricket football, golf, rugby, scocer and tennis), lawns, parks and other types of landscaping. The grass is also useful as an animal feedstuff for cattle, goats, horses and sheep, due to its increased vegetative growth, improved digestibility and/or nutritional value as animal feedstuff. This sequence represents the Arshidopsis thaliana homeobox gene Athl encoded protein. Athl is
                                                                                                                                                                                                                                                                                                                                                                    New genetically modified grass useful for growing and/or propagating grass in athletic fields (for sports such as baseball, cricket, football, golf, rugby, soccer and tennis), or as animal feedstuff for cattle, goat, horse and sheep.
                                                                                                                                                                                                                                             Van Der Valk P, Van Dun CMP, Smeekens SCM, Proveniers MCG;

'plant transcription factor polynucleotides and polypeptides, useful producing transgenic plants with commercially valuable properties, ih as an alteration in a plant growth characteristic, e.g. growth rate apomixis.	ure; SEQ ID NO 333; 454pp; English.	The invention relates to a number of isolated Arabidopsis thaliana cDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant transcription factor polynucleotides and polypeptides are useful in producing transpenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant, such as an altered desirable traits as compared to a reference plant, such as an altered desirable traits as compared to a reference plant, such as an altered desirable traits of plants and seedlings, or leaf and flower senescence. Sequence information related to the polynucleotides and polypeptides can also be used in bioinformatic search methods. The transgent plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                         The present sequence is Arabidopsis thaliana transcription factor homologue. The transcription factors are used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugarcane, turf, banana, blackberry, blueberry, strawberry, raspberry, carrot, cantaloupe, cauliflower, cucumber, coffee, eggplant, grapes, mango, lettuce, homeydew, melon, onlon, papaya, peppers, pinaepple, spinach, squash, sweet corn, tobacco, tomato, peak, watermelon, rosaceous fruits and vegetable brassicas. The transcription factors are specifically useful for modifying traits associated with plant's pathogen tolerance such as allerations in cell wall composition, trichome number or structure, callose induction, phytoalexin induction, and alterations in the cell death response. Transgenic plants expressing these transcription factors are more tolerant to biotrophic or necrotrophic pathogens such as fungi, bacteria, mollicutes, viruses, nematodes and parasitic higher plants. The transcription factors are also used in gene therapy

The present sequence is Arabidopsis thaliana transcription factor. The transcription factors are used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, portato, cotton, rice, oilseed rape, sunflower, alfalfa, sugarcane, turf, banana, blackberry, blueberry, strawberry, raspberry, carrot, cantaloupe, cauliflower, coffee, cucumber, eggplant, grapes, mango, lettuce, honeydew, melon, onlon, papaya, peas, pepers, pienapple, spinach, caquash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and vegetable brassicas. The transcription factors are specifically useful for modifying traits associated with plant's pathogen tolerance such as alterations in cell wall composition, trichome number or structure, callose induction, phytoalexin induction, and alterations in the cell death response. Transgenic plants expressing these transcription factors are more tolerant to biotrophic or necrotrophic pathogens such as fungi, bacteria, mollicutes, viruses, nematodes and parasitic higher plants. The transcription factors are also used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                357

Disclosure, SEQ ID NO 236; 470pp; English. XX XX XX CC The invention relates to a number of cDNA sequence and their encoded corpore ins which are especially transcription factor cDNAs and their proteins. The isolated or recombinant polynuclectide is useful for producing a modified plant with a modified trait, e.g. enhanced tolerance to environmental conditions, improved tolerance to microbial, fungal or viral diseases, improved tolerance to pest infestation, decreased controllity to take up heavy metals; improved growth under poor photoconditions, improved nutrient uptake, or reduced hormone comprising the desired trait. The polynucleotides and polypeptides are comprising the desired trait. The polynucleotides and polypeptides are comprising the desired trait. The polynucleotides and polypeptides are comprising the desired trait. The polynucleotides and polypeptides are compressed in bioinformatic search methods. This sequence represents one XX Sequence 739 AA;	Alignment Scores: 1.21e-34 Length: 739 Score: 424.00 Matches: 155 Servent Similarity: 41.02% Conservative: 94 Best Local Similarity: 25.54% Mismatches: 171 Cuery Match: 7 Gaps: 24 US-09-423-575-1 (1-1886) x ADE37297 (1-739)	Oy 289 TTCATAGAAACCCAATGGACAACAAC	ilitysGlnGluHisGlnargValGluWetAspGluGl TRACCTTCAAGAGAGTTCAACTTCATTCTCAACAAT 	111	Qy 586
